

Coating is the physical process of laying a liquid or solid onto the surface of a paper, fibre or fabric. The objective is to achieve uniformity of coverage (uniformity of weight distribution) while controlling the variance of thickness of the coating.

Coating is most typically seen in pre-preg systems for the application of a resin to a paper or film.

The technology features precision-ground ceramic or chrome-plated coating rolls, with integrated resin mixing and delivery systems.

The ultimate in coating precision and performance; forward and reverse roll coaters are used in aerospace pre-preg lines to give tight control of coating weight and resin distribution.

Forward and reserve roll coaters are also able to handle a wide range of coating agents, densities and viscosities.

FORWARD AND REVERSE ROLL COATING

Common features include:

- Precision ground coating rolls with ceramic or chrome roll facing
- Precision gap control – manual & automatic
- Side dam width adjustment
- Integrated resin delivery and mixing systems
- Resin preparation systems
- Die, blade or roll to distribute coating
- Used for high-end aerospace materials such as prepregs
- Supplied as lab scale to 1780mm (70”) wide production lines
- Provides the tightest level of specifications and product requirements
- Ability to utilise feedback from coat weight measurement device
- Opposing rolls regulated the movement of the coating agent and the substrate
- Online control of gap between opposing rolls
